2	2420030742	I.Srivalli
Name of the Guide		DR.N.SUNANDA

Abstract

The “**Student Performance Analytics Dashboard**” is a data science-based system designed to analyze and visualize student academic performance using various academic and demographic factors. The system uses a student performance dataset containing information such as study time, absences, previous grades, and other relevant student attributes. The data is cleaned and analyzed using Python libraries such as Pandas, NumPy, Matplotlib, and Seaborn to identify important patterns and relationships affecting student performance. An interactive dashboard is developed using Streamlit to present key performance indicators, charts, and correlation analysis in an easy-to-understand format.

The system helps educators and institutions identify factors influencing academic performance and recognize students who may require additional support. An optional machine learning component can also be incorporated to predict student scores based on selected features. The proposed system provides a simple and interactive approach for understanding student performance and supporting data-driven academic decision-making.

The dashboard helps users view average marks, attendance, study hours, grade distribution, and the relationship between attendance, study hours, and marks. The main aim of the project is to convert student data into simple visual insights that can help understand academic performance.
